

## Sphinx cleans and packages medical technology tools in its own cleanroom

With immediate effect, Sphinx Tools Ltd. in Derendingen/Switzerland will be providing customers from the Medical Technology field with surgical instruments which are cleaned, packaged and consistently documented. For this purpose, the globally recognised specialist for medical instruments and industrial drilling and milling tools in Derendingen operates its own equipped cleanroom. This corresponds to class 8 in accordance with DIN EN ISO 14644-1. The maintenance of the clean state in accordance with these specifications is continuously monitored and documented. The specially trained personnel in Derendingen can process several thousand instruments daily, where they are cleaned in automated cycles,

followed by packaging and labelling. All of the production steps are traceably monitored in Derendingen, from the material batch and its processing to the measuring technology used for quality assurance all the way up to cleaning and packaging. The manufacturer thus ensures that customers from the medical technology field always receive instruments of consistent quality, regardless of changing environmental conditions. The instruments can be prepared directly for the operating room. This greatly reduces the time and cost required for logistics and optimises process reliability.
